/Melvin Curtis Mayes/ Supervisory Patent Examiner, Art Unit 1793			

Continuation of 11. does NOT place the application in condition for allowance because: the cited EP 1113516 still qualifies as 102(a) reference with a publication date. There is no perfected claim of priority (i.e. no English translation) for the priority document Germany 102004005935. It is noted that the filing date of the priority document is not perfected unless applicant has filed a copy of the certified priority document in the application and an English language translation, if the document is not in English (see 37 CFR 1.55(a)(3)) and the examiner has established that the priority document satisfies the enablement and description requirements of 35 U.S.C. 112, first paragraph. All the arguments have been clearly addressed in previous office action. Furthermore, Rock expressly teaches drawing electric current from the fuel cell to assist in completing the heating of the fuel cell up to its normal temperature and start internal IR heating of the fuel cell stack with circulated coolant thereof([0009], [0016]). it is noted that a pump need certain power for normal function while when fuel cell warmed to a first subfreezing temperature can provide electric current for intended usage as suggested by Rock, thus to one of ordinary skill in the art it would have been obvious to adopt such power sources provided by fuel cell to make the coolant pump work thus provided needed coolant for further heating the fuel cell stack.
